

Everything below is committed and pushed. Sections 2–4 are the only places your hands are needed — each one is a short checklist. Deep production detail lives in **PRODUCTION.md**; the marketing kit in **MARKETING.md**.

1 · What's live right now (nothing needed from you)

Piece	Where
10 narrated films — 5 chronicles + 5 Character Films	<code>movies.html</code>
Teaching layer: all 104 scenes carry a lesson strip in the player	every film
Film Study shelf: 10 cards — protocol, rule, 10-minute drill, next move	<code>movies.html</code>
Real key art on the five Character Film posters	<code>movies.html</code>
Production pack export per film (.xls: script + lessons + shots + study)	poster buttons
Viewing Path ladder (level 0 to 3, concern quick-picks)	<code>movies.html</code>
Playbooks deck, DNA scan, Time Audit, Profit Lab, AI Family roster	site-wide

To publish all of it on the public site: merge branch `claude/ai-family-factory-run-8cy558` into the default branch (ask and the pull request gets opened for you) — the Pages deploy follows automatically.

2 · Character voices — ElevenLabs (about 10 minutes)

The pipeline is committed (`tools/voice-elevenlabs.mjs` + `tools/voices.config.json`). Two steps only you can do:

[] **Create an API key** in your ElevenLabs account (`michaelparks011`): Profile, then API Keys, then Create. Put it in the Claude Code environment settings as `ELEVENLABS_API_KEY` — **never** paste it into chat or the repository. The cloud sandbox currently blocks `api.elevenlabs.io`, so either allow that host in the environment's network settings, or run the command below on your own computer (Node 18+, zero installs).

[] **Cast the six voices**: for each entry in `voices.config.json`, pick a Voice Library voice (search terms included) or design one from its direction text, then paste the voice ID into the file. Voice IDs are safe to commit; only the API key is secret.

Then render narration, one film at a time:

```
ELEVENLABS_API_KEY=... node tools/voice-elevenlabs.mjs --movie mv-c1
node tools/voice-elevenlabs.mjs --movie mv-c1 --dry-run # preview, no key, no cost
```

Why the website can't be driven for you: this sandbox has no general web access (verified with a control probe), and account logins are a human-only step everywhere. The API-key path is the working bridge — scripted, repeatable, and it feeds straight into the video pipeline.

Casting policy (locked): original synthetic voices from the ElevenLabs library or Voice Design only. Never clone a real person's voice or imitate an actor.

3 · Real AI-generated scenes — Higgsfield (copy-paste, your account)

Re-checked this session: Higgsfield has no API or connector an agent can drive — it works only through its web app, logged in as you. The packs make your side trivial:

[] Open **PRODUCTION.md**, section “Character Films — AI generation packs”: per-film identity blocks (Rosa, Sal, Amara & Josef, Ben, Lena) plus three hero shots per film, written in the exact prompt grammar. Paste them straight into Higgsfield (or Veo / Kling). Start with INBOX ZERO (Rosa).

[] Need the full film? Every poster's **production pack (.xls)** carries a B-roll prompt for every scene — that's the complete shot list.

[] Presenter avatar scenes: authorize the **HyperFrames (HeyGen)** connector in `claude.ai` Settings, then Connectors — avatar renders can then be driven for you from a `claude.ai` chat.

Meanwhile the in-repo pipeline already renders real MP4s with no external service — the Character Films teaser on `movies.html` was made entirely inside this repository, and more can be rendered on request.

4 · Fastest wins, in order

1. **Merge to the default branch** — the whole teaching layer goes live on the public Pages site.
2. **Set ELEVENLABS_API_KEY and cast the six voices** — films gain real character voiceover — the biggest single jump in production value available today.
3. **Paste one identity block + three hero shots into Higgsfield** — first photoreal scenes for one film.
4. **Authorize HyperFrames (HeyGen) in claude.ai connectors** — presenter avatar scenes become drivable from chat.
